

# Health Data Platform BC

is a single, secure platform that provides access to health data from multiple organizations.

The platform protects sensitive health data by controlling access, logging and monitoring activity, and reviewing output.

People in government, health authorities and research can request access to data, and bring their own data.

The results from data analysis can help develop policy, evaluate programs, inform strategy, support academic research and more.

People access data through a secure virtual desktop with industry-standard analytics tools. Each person has their own protected storage for imported project data.
